Pratice Code

START HERE | Windows desktop app + local website

1. Install the desktop app - recommended

Open **Installer**, then double-click **Pratice-Code-Setup.exe**. This is the installer you should use.

Choose an installation folder and finish Setup. You can create Desktop and Start menu shortcuts. After installation, open the **Pratice Code** shortcut for everyday use.

The app opens in its **own desktop window**. Python, the rendering runtime and the study content are included. You do not need to open a browser or install Python separately.

2. Which file should I open?

File in this project folder	What it does
`Installer\Pratice-Code-Setup.exe`	**Install once.** Creates an installed copy and optional shortcuts.
`App\Pratice Code.exe`	**Run directly.** Opens the ready-to-use desktop app without installing again.
`OPEN_APP.cmd`	Convenient launcher for the same desktop app in the App folder.
`OPEN_WEBSITE.cmd`	Opens the optional local website in your browser. See page 2.

3. Start studying

Use **Coding Lab**, **Practice**, **Learn**, **Exams**, **Library** and **Progress**. In Library, choose **Level wise** for Service-Based, Product/Fintech/Finance and Top-Tier preparation. The three original PDF guides open offline.

C/C++ and Java execution additionally need a local compiler/JDK. Python, JavaScript, SQLite, web previews and the included study material work offline. External source links need internet only when you choose to visit them.

4. Run the local website with CMD / browser

Step 1. Keep the complete Pratice_Code_Project folder together. Double-click **OPEN_WEBSITE.cmd**.

Step 2. The browser opens **http://127.0.0.1:8787/**. If necessary, type this address yourself after starting the website.

Step 3. To stop the website, double-click **STOP_WEBSITE.cmd**. To stop the desktop app, close its app window and allow the folder save to finish.

The Website folder contains the complete source project. Its own Start Pratice Code.cmd and Stop Pratice Code.cmd are also available. This collected bundle includes a local Python runtime for website mode. If you later use a source-only GitHub ZIP, install Python 3.10+ first.

5. Where activity and saved code are stored

Your activity, saved programs, drafts, notes, progress and study history are automatically written inside the folder used by that copy.

Copy you are using	Saved data file, relative to this folder
Ready-to-run desktop app	`App\studio-private\.codelab-data\progress.json`
Local website	`Website\studio-private\.codelab-data\progress.json`
App installed through Setup	Inside your chosen install folder: `studio-private\.codelab-data\progress.json`

The desktop cache is also kept inside **App\studio-private\desktop-profile**. In the app, click the saving-status indicator to check folder saving or open the saved-data folder.

Before moving to another computer, use **Progress → Back up all progress**. Restore that JSON backup on the other copy. Keep your complete App or Website folder to retain its local data.

6. Use the latest clear-text build

Use the files in this folder. The desktop executable includes the Windows DPI/scaling fix for sharp text. Close older preview copies before using the updated app.

Main project location: D:\Coding\Pratice_Code_Project. Application source is in Website. Installer packages contain the app content; your local saved work stays in the data folders described above.
